AI-USE EVIDENCE APPENDIX

Software Engineering — Assignment #04

Assistant and date

Assistant: ChatGPT, GPT-6
Date: 6 November 2026
Project: Smart Campus Room Availability Checker

Context provided

Assignment #04 PDF requirements; uploaded Assignment #03 ZIP; file inventory; original booking.py and test_booking.py; and notice that the original frontend source export was not present.

Prompt summaries

• Inspect the existing project and identify reusable baseline materials.

• Create a prioritized plan for room catalog, filtering, refactoring and tests.

• Implement separate data, domain, application and UI modules.

• Add regression, boundary, filter and integration tests; execute test commands.

• Prepare documentation and report from verified implementation and results.

Outputs used

• Five fictional room records with independent bookings

• Availability and room-filter modules

• Selected-room application service

• Responsive HTML/CSS/JavaScript UI

• 26 executable Node tests

• Preserved Python baseline and regression suite

Recommendations rejected or modified

Live system time — rejected. The assignment requires fixed demo time; the app uses 09:00.
Hide blocked rooms — modified. Blocked rooms remain visible and marked, but availability always returns false.

Human verification

Room fixture fields, capacity predicate, all-items equipment predicate, time validation, overlap rule, immutable booking behavior, selected-room lookup and test outputs were reviewed. Full manual browser, physical-device, keyboard-only and screen-reader checks remain limitations.

Executed verification

node --test: 26 passed, 0 failed.
python -m unittest -v test_booking.py: 4 unittest methods passed, 0 failed; the acceptance test includes 36 subcases.
Evidence: evidence/node_tests.txt and evidence/python_regression_tests.txt.
